Estimating Drought 2000's Cost on Georgia's Agriculture and Rural Economy

John C. McKissick, Brigid A. Doherty, R. Jeff Teasley and Bill Givan⁽¹⁾

Center for Agribusiness and Economic Development

The University of Georgia

July 2000

Center Special Report No. 11

County tables and graphs for normal year and drought year production and value estimates are located at the bottom of this document

What will the 2000 drought cost agriculture and what impact will it have on Georgia's fragile rural economies? These are hard questions to definitively answer until the crop production year is completed. However, to help get a perspective on these important questions, the University of Georgia's College of Agricultural and Environmental Sciences' Center For Agribusiness and Economic Development has estimated drought costs on a county-by-county basis as of July, 2000.

The estimates are derived from the emergency declaration surveys used by USDA to establish the designation of all 159 counties in Georgia as disaster areas. Based on this survey, the farm level losses to the drought of 9 primary summer crops are pegged at \$689 million when compared to production in a normal crop year. In addition to the production lost, Georgia producers have increased irrigation cost of around \$50 million, placing the total estimated cost of the drought at \$739 million. Georgia producers are not the only people affected. The total impact on rural Georgia will be many times the loss production value due to reduced commodity processing and production input purchases.

Every portion of the state's agriculture has been affected, although the largest losses are expected in the South Georgia crop production counties. The largest crop counties have the greatest expected losses. The largest losses are estimated to be in Mitchell (\$29.97 million), Early (\$20.22 million), Sumter (\$20.17 million), Colquitt (\$19.06 million) and Dooly (\$16.48 million) counties.

The total estimated state loss from the 9 primary summer crops amounts to 689 million dollars. This represents a loss of about 39 % of a normal year's production. The largest anticipated loss is in cotton production, the states' number 1 row crop, at \$233 million. Crops directly associated with the production of beef and dairy cattle have the next highest projected loss as pasture losses are pegged at \$177 million, hay at \$89 million, and silage at \$3.5 million dollars. These losses will be particularly hard on beef and dairy operations as forage crops are not generally covered by crop insurance. The forage loss is valued at the cost of replacement feed. Producers may have suffered lower weight gains or had to liquidate herds because of the reduced pasture feed supplies. No attempt was made to directly value such losses. Replacement feed supplies are the natural proxy for weight gain or liquidation losses, but will likely understate actual losses.

Estimated Production Losses By Commodity

Crop	Estimated Value of Production Lost to Drought, July 2000	"Normal" Year Total Value of Production	% Decline From "Normal" Year	% Decline From 1999's Actual Production
Corn	\$38,898,321	\$90,723,183	43%	47%
Cotton	\$233,198,514	\$670,034,624	35%	40%
Peanuts	\$41,287,166	\$381,204,937	11%	11%
Soybeans	\$17,166,972	\$30,883,089	56%	68%
Tobacco	\$36,120,084	\$118,479,218	30%	31%
Hay	\$89,084,476	\$137,608,595	65%	N/A
Silage	\$3,532,190	\$6,521,214	54%	30%
Pasture	\$176,778,943	\$250,432,875	71%	N/A
Pecans	\$52,619,587	\$97,310,187	54%	51%
TOTAL	\$688,686,252	\$1,783,197,921	39%	

Each county's normal year production was calculated using 1999 county yields normalized for the state's 5 year average production, multiplied by the acres indicated to be planted in the county's disaster damage assessment report. The likely production for this year was calculated using the projected yield and actual planted acreage from each county report. The likely and normal production was valued by the likely harvest cash price plus government payments directly tied to production (loan deficiency payments) and byproduct values such as cottonseed.

It is important to note that the estimated loss is calculated for 9 crops only. While the losses in these crops will represent most of the agricultural production lost to the drought, significant losses are also likely in fruit and vegetable production and ornamental horticultural production. Also, no attempt has been made to adjust the expected market prices for reduced quality. Drought stressed peanuts, cotton, and corn are all expected to suffer price discounts due to quality reductions.

It is also important to keep in mind that these estimates are as of the first of July. Actual yields will be affected by weather during the remainder of the growing season. But, this year's drought, unlike many previous droughts, started before summer crop planting and has already affected potential yields through reduced stands. In fact, many acres of crops that would have been planted were not and others that were planted have now been abandoned due to limited crop potential. Pasture and hay forage lost the first of the season can not be

recovered no matter the rainfall the remainder of the summer.

Georgia's agricultural production losses would be much greater if not for the estimated 54% of the major row crops under irrigation. However, irrigated crop producers have had to irrigate much more often than in normal crop years and in a year when the energy cost of irrigation has doubled. It is estimated that additional irrigation cost will be around \$50 million. So the total estimated cost of the drought is well over \$730 million.

The direct agricultural production loss will not be the only cost incurred in rural Georgia this year. Producers will not likely add as much fertilizer and chemicals to dryland crops. Each dollar of crop production adds about another \$.50 to the local economy as input supplier's employment and associated cost ripples through the economy. So a \$689 million loss of agricultural production has the potential to reduce economic activity by approximately \$1 billion from the input supply side alone. Since the drought developed early in the growing season, some of this impact will be felt in this year, but not all, as fertilizer and other inputs were purchased and applied before the crop was planted. However, those acres not planted and those purchases not made after crop planting will have impacts beyond the loss production through its effect on input supply businesses. Next year input suppliers may be hit harder as some producers face financial ruin due to the drought.

The more direct impact from drought reduced production on the overall economy, but specifically rural Georgia, will be on those processing businesses directly tied to the production of the various commodities. Cotton gins will not have enough cotton to gin, cotton seed oil processors will not have as much cotton seed to crush, peanut and tobacco warehouses will be partially empty, and pecan processors will operate at partial capacity. All of these businesses, directly dependent on local production, will have reduced sales and employment, further reducing the economic activity in the local economy. The economic chain reaction can easily reduce a local economy's output by \$3 for each \$1 of agricultural production.

1. John C. McKissick is Professor and Extension Economist, Brigid A. Doherty and R. Jeff Teasley Research Coordinators, and Bill Givan an Extension Economist, all with the College of Agriculture and Environmental Sciences, The University of Georgia, Athens Georgia.
